

Used Parts for Forklifts

Used Forklift Part - Over time, lift truck components will wear and have to be replaced. Obtaining new parts can become a costly undertaking so another idea is to acquire used forklift parts. This could save a lot of money eventually. It is a great idea to purchase used lift truck components that have been remanufactured. These components will ensure that you are getting parts which will work for a long time and be productive.

Broken or worn parts which are remanufactured are a cheaper answer compared to rebuilding. With rebuilding components, only the components that are broken or worn out get changed, which means that other wearable components might break down soon after acquisition.

Remanufacturing on the other hand provides the best guarantee for second-hand components. Reproduced components are taken apart and cleaned and then all wearable pieces are replaced. All wearable components are replaced regardless of age or wear which is one more rationale why reproduced components generally operate so much better. Any component within the part is brand new and this provides far longer life to the second-hand part. Depending on the forklift components that are being redone, the cleaning process and the entire remanufacturing process will vary.

The engines are cleaned after a complete disassembly. Different engine components like for example rings, pistons, spark plugs, valve springs, filters, and valves can be replaced during the process of remanufacturing. The engines are hot tested after reassembly to guarantee that there are no leaks, no noises, no oil pressure problems or any vacuum.

Transmissions are another item that is oven cleaned after being disassembled. The transmission is then washed. A comprehensive examination is performed to be able to check for any cracks. Bearings, bushings and seals are all replaced. Normally, the replacement parts used on transmission parts meet OEM specifications.

A few lift truck parts like for example the water pump, torque converters, the alternator, the starter and steer axles can be quite serviceable after worn components are replaced. The electronic control in the electric lift truck is maintained by the control card. This card could also be reproduced with replacing all aged and worn out parts. Unlike different forklift parts the control card could only have the worn and aged components replaced.

Remanufactured parts are thoroughly examined upon reassembly to guarantee they are in top condition previous to being sold. It is essential when buying remanufactured parts to be sure they have undergone the proper testing and inspection procedures. On certain larger components such as steer axles, engines and transmissions, OEM specification replacement parts should be utilized.

The forklift dealer can guarantee that the components they have remanufactured meet the OEM specifications. This would even ensure the components meet industry standards. Lots of details go into remanufacturing second-hand parts. This attention to detail offers more serviceability out of remanufactured parts compared to the parts that were merely rebuilt.
